

MUSKELLUNGE CREEK BEAVER CONTROL UPDATE

Kelly Thiel, Wildlife Damage Biologist at the Rhinelander USDA office, recently reported that beaver activity developed again this summer approximately mid-stream between Muskellunge and Little St. Germain Lakes. Three dams were built by beavers and removed by USDA field staff. Several beavers were trapped. Stream flow remains good. Monitoring continues per our contract.

Many thanks to USDA personnel for their diligence in maintaining proper stream flow throughout the creek.
